  - Girvan-Newman algorithm
  - Spectral clustering
- Conclusions

# Degree Distribution

- Degree distribution : Probability that a randomly chosen node has degree  $k$ 
    - $N_k = \# \text{ nodes with degree } k$
  - Normalized:
    - $P(k) = N_k / N \rightarrow \text{plot}$
- <https://eduassistpro.github.io/>  
Add WeChat edu\_assist\_pro

# Paths in a Graph

- A **path** is a sequence of nodes in which each node is linked to the next one

Assignment Project Exam Help

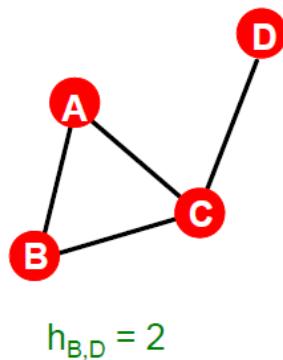

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- Path can intersect itself and pass through the same edge multiple times

- E.g.: ACBDCDEG
- In a directed graph a path can only follow the direction of the “arrow”

# Distance in a Graph

$$h_{B,D} = 2$$

- **Distance (shortest path, geodesic)** between a pair of nodes is defined as the number of edges along the shortest path.
- Assignment Project Exam Help  
<https://eduassistpro.github.io/>  
\*If the two nodes are disconnected, the distance is infinite

- In **directed graphs** paths need to follow the direction of the arrows
  - Consequence: Distance is **not symmetric**:  
 $h_{A,C} \neq h_{C,A}$

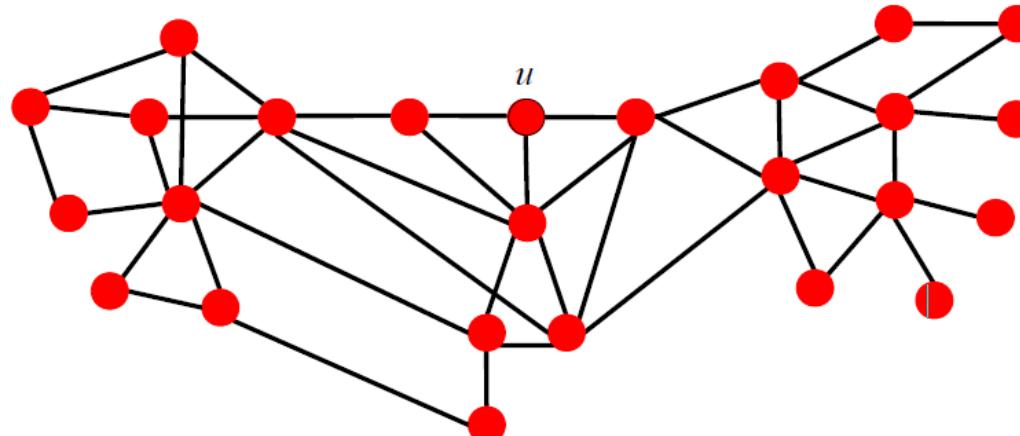

# Network Diameter

- **Diameter**: the maximum (shortest path) distance between any pair of nodes in a graph
- **Average path length**:  
or a strongly connected graph (component)  
<https://eduassistpro.github.io/>  
graph:  
Add WeChat edu\_assist\_pro
- Many times we compute the average only over the connected pairs of nodes (we ignore “infinite” length paths)

# Finding the Shortest Path

- **Breadth-First Search:**

- Start with node  $u$ , mark it to be at distance  $h_u(u)=0$ , add  $u$  to the queue
- While the que <https://eduassistpro.github.io/>
  - Take node  $v$  off the queue, put it neighbors  $w$  into the queue and mark  $h_u(w)=h_u(v)+1$

# Clustering Coefficient

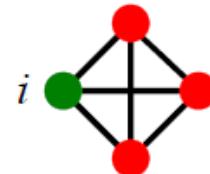

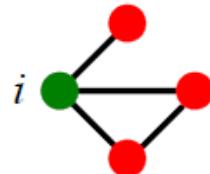

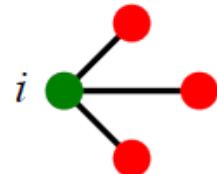

- **Clustering coefficient:**

- What portion of  $i$ 's neighbors are connected?  
**Assignment Project Exam Help**
- Node  $i$  with degree  $d_i$

<https://eduassistpro.github.io/>

where  $e_i$  is the number of edges between the neighbors of node  $i$ .

**Add WeChat edu\_assist\_pro**

# Clustering Coefficient

  - Spectral clustering
- Conclusions

# Community Detection

How to find communities?

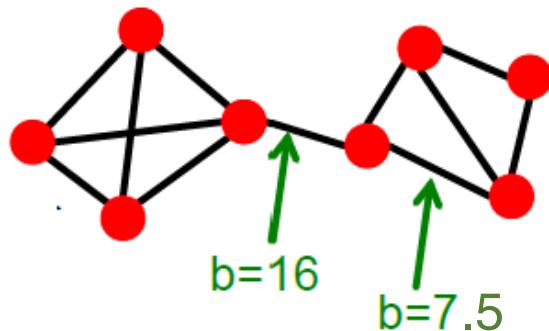

We will work with **undirected** (unweighted) networks

# Betweenness: Strength of Ties

- **Edge betweenness**: number of shortest paths (among all pair of vertices) passing over the edge.
- If there is more than one shortest path between a pair of nodes, each path is assigned equal weight such that the total weight of all paths is 1.

<https://eduassistpro.github.io/>

Add WeChat `edu_assist_pro` for simple algorithm calculating betweenness.

1. Repeat for each vertex
  - a) compute its shortest path to all other vertices.
  - b) for each edge, count the number of the shortest paths passing over the edge
2. Sum up the results from each vertex.

# Betweenness: Strength of Ties

  - Girvan-Newman algorithm
  - Spectral clustering
- Conclusions

# Graph Partitioning

- Undirected graph  $G(V,E)$ :

Assignment Project Exam Help

- Bi-partitioning task <https://eduassistpro.github.io/>

- Divide vertices into two disjoint group

Add WeChat edu\_assist\_pro

- Questions:

- How can we define a “good” partition of  $G$ ?
- How can we efficiently identify such a partition?

# Graph Partitioning

- **What makes a good partition?**

- Maximize the number of within-group connections
- Minimize the number of between-group connections

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Graph Cuts

- Express partitioning objectives as a function of the “edge cut” of the partition
- Cut: Set of edges in a group:

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Graph Cut Criterion

- **Criterion: Minimum-cut**

- Minimize weight of connections between groups

Assignment Project Exam Help

- **Degenerate case** <https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- **Problem:**

- Only considers external cluster connections
  - Does not consider internal cluster connectivity

# Graph Cut Criterion

- **Criterion: Normalized-cut** [Shi-Malik, '97]
  - Connectivity between groups relative to the density of each group  
<https://eduassistpro.github.io/>
  - $\text{vol}(A)$ : total weight of the edges with at least one endpoint in  $A$
- **Why use this criterion?**
  - Produces more balanced partitions
- **How do we efficiently find a good partition?**
  - **Problem:** Computing optimal cut is NP-hard

# Spectral Graph Partitioning

- $A$ : adjacency matrix of undirected  $G$ 
  - $A_{ij} = 1$  if  $(i, j)$  is an edge, else 0
- $x$  is a vector in  $\mathbb{R}^n$  with components  $(x_1, \dots, x_n)$ . Think of it as a label/value of each node <https://eduassistpro.github.io/>
- What is the meaning of  $Ax$ ?  
Add WeChat edu\_assist\_pro

$x_j$

- Entry  $y_i$  is a sum of labels  $x_j$  of neighbors of  $i$

# What's the Meaning of $Ax$ ?

$$\begin{bmatrix} a_{11} & \dots & a_{1n} \\ \vdots & & \vdots \\ a_{n1} & \dots & a_{nn} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} = \lambda \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$$

- ***j*th coordinate of  $Ax$ :**

- Sum of the  $x$ -values of neighbors of  $j$
- Make this a new value at node  $j$

Assignment Project Exam Help

$$A \cdot x = \lambda \cdot x$$

- **Spectral Graph** <https://eduassistpro.github.io/>

- Analyze the “spectrum” of matrix  $G$
- **Spectrum:** Eigenvectors  $x_i$  of a matrix  $G$  are defined by the magnitude (strength) of their corresponding eigenvalues  $\lambda_i$ :

$$\Lambda = \{\lambda_1, \lambda_2, \dots, \lambda_n\}$$

$$\lambda_1 \leq \lambda_2 \leq \dots \leq \lambda_n$$

# Example: d-Regular Graph

- Suppose all nodes in  $G$  have degree  $d$  and  $G$  is connected
  - What are some eigenvalues/vectors of  $G$ ?
  - $A \cdot x = \lambda \cdot x$  What is <https://eduassistpro.github.io/>
    - Let's try:  $x = (1, 1, \dots, 1)$
    - Then:  $A \cdot x = d \cdot d \cdot \dots \cdot d = \lambda \cdot x$ . So:  $\lambda = d$
  - We found eigenpair of  $G$ :  $x = (1, 1, \dots, 1)$ ,  $\lambda = d$

Remember the meaning of  $y = A \cdot x$ :

$$y_i = \sum_{j=1}^n A_{ij} x_j = \sum_{(i,j) \in E} x_j$$

# $d$ is the Largest Eigenvalue of $A$

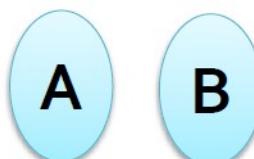

- $G$  is  $d$ -regular connected,  $A$  is its adjacency matrix
- **Claim:**
  - $d$  is largest eigenvalue of  $A$
  - $d$  has multiplicity  $0$  associated with eigenvalue  $d$
- **Proof: Why no eigenvalue  $\lambda > d$ ?**
  - To obtain  $d$  we needed  $x_i = x_j$  for every  $i, j$
  - This means  $x = c \cdot (1, 1, \dots, 1)$  for some const.  $c$
  - **Define:**  $S = \{i \mid x_i = \max_j x_j\}$
  - Then consider some vector  $y$  which is not a multiple of vector  $(1, \dots, 1)$ . So not all nodes  $i$  (with labels  $y_i$ ) are in  $S$
  - Consider some node  $j \in S$  and a neighbor  $i \notin S$  then node  $j$  gets a value strictly less than  $d$
  - So  $y$  is not eigenvector! And so  $d$  is the largest eigenvalue!

# Example: Graph on 2 Components

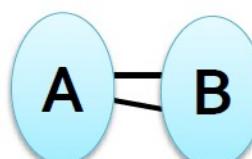

- What if G is not connected?
  - G has 2 components, each d-regular
- **Assignment Project Exam Help**
- **What are some**
  - $x = \text{Put all } 1\text{s on A and } 0\text{s on B}$  <https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- And so in both cases the corresponding
- A bit of intuition

$$\lambda_n = \lambda_{n-1}$$

$$\lambda_n - \lambda_{n-1} \approx 0$$

2<sup>nd</sup> largest eigval.  
 $\lambda_{n-1}$  now has  
value very close  
to  $\lambda_n$

# More Intuition

- More Intuitions

Assignment Project Exam Help

- If the graph is complete (ie) then we already know that  $x_n = (1, \dots, 1)$  is an eigenvector.  
Add WeChat edu\_assist\_pro
  - Since eigenvectors are orthogonal then the components of  $x_{n-1}$  sum to 0.
- So we can look at the eigenvector of the 2<sup>nd</sup> largest eigenvalue and declare nodes with positive label in A and negative label in B. **But there is still lots to sort out.**

# Matrix Representation

- **Adjacency matrix (A):**

- $n \times n$  matrix
- $A = [a_{ij}]$ ,  $a_{ij} = 1$  if edge between node  $i$  and  $j$

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- **Important properties:**

- Symmetric matrix
- Eigenvectors are real and orthogonal

# Matrix Representation

- **Degree matrix (D):**

- $n \times n$  diagonal matrix

- $D = [d_{ii}]$ ,  $d_{ii} = \text{de}$

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Matrix Representation

- **Laplacian matrix (L):**

- $n \times n$  symmetric matrix

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- **What is trivial Eigenpair?**

- $x = (1, \dots, 1)$  then  $L \cdot x = 0$  and so  $\lambda = \lambda_1 = 0$

- **Important properties:**

- **Eigenvalues** are non-negative real numbers
  - **Eigenvectors** are real and orthogonal

# Facts about Laplacian $L$

- (a) All eigenvalues are  $\geq 0$
- (b) for every  $x$  Assignment Project Exam Help
- (c) <https://eduassistpro.github.io/>  
Add WeChat edu\_assist\_pro
- That is,  $L$  is **positive semi-definite**

# as Optimization Problem

- Fact: For symmetric matrix  $L$ :

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# as Optimization Problem

- **What else do we know about  $x$ ?**

- $x$  is unit vector:

Assignment Project Exam Help

- $x$  is orthogonal to 1st eigenvector ( $\cdot, \dots, \cdot$ ) thus:

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- Remember

We want to assign values  $x_i$  to nodes  $i$  such that few edges cross 0. (we want  $x_i$  and  $x_j$  to subtract each other)

# Finding Optimal Cut [Fiedler'73]

- Back to finding the optimal cut
- Express partition  $(A, B)$  as a vector

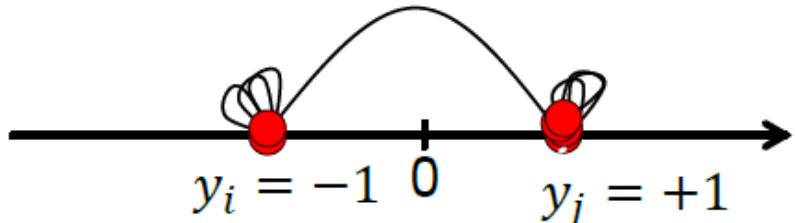

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- We can minimize the cut of  $t_n$  by finding a non-trivial vector  $x$  that **minimizes**

Add WeChat edu\_assist\_pro

Can't solve exactly. Let's relax  $y$  and allow it to take any real value.

# Rayleigh Theorem

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- The minimum value of  $f(y)$  is given by the smallest eigenvalue  $\lambda_2$  of the Laplacian matrix  $L$
- The optimal solution for  $f(y)$  is given by the corresponding eigenvector  $x$ , referred as the **Fiedler vector**

# Approx. Guarantee of Spectral (details)

- Suppose there is a partition of  $\mathbf{G}$  into  $\mathbf{A}$  and  $\mathbf{B}$  where  $A \leq |B|$ , s.t. then .
  - This is the approximation guarantee of the spectral clustering.
  - It says the cut <https://eduassistpro.github.io/> from the optimal one of score .

Add WeChat edu\_assist\_pro

# So Far..

  - Basics of Graph
  - Important projects <https://eduassistpro.github.io/graphs/>
  - Analysis of a real-world social network [Add WeChat edu\\_assist\\_pro](https://eduassistpro.github.io/graphs/social-networks/wechat.html)
- Community detection algorithms
  - Girvan-Newman algorithm
  - Spectral clustering
- Conclusions

# Conclusions

- **How do we reason about networks?**
  - Empirical: Study network data to find organizational principles. How do we measure and quantify networks?
- **Mathematic** <https://eduassistpro.github.io/>
  - Graph theory, statistical mode
    - allow us to understand behavior
    - expected phenomena
- **Algorithms**
  - for analyzing graphs
    - Hard computational challenges

# Conclusions: This is Just a Beginning

# One-Slide Takeaway

- Key concepts of social graphs
  - Undirected/Directed Graph/Adjacency Matrix
  - Shortest path/
  - Degree distrib <https://eduassistpro.github.io/client>
  - Real world graph
    - Degree distribution: high-skew
    - Most path lengths are small
- Community detection algorithms
  - Purpose of community detection
  - Spectral clustering

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat [edu\\_assist\\_pro](https://edu_assist_pro) on World Wide Web

# In-class Practice 1

- For the graph on the right, compute:

- The adjacency matrix
- The degree matrix
- The Laplacian

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# In-class Practice 2

- For the graph on the right, compute:

- The shortest path between each pairs of nodes
- The betweenness centrality of each edge
